

PART IV-CONCLUSIONS AND RECOMMENDATIONS

Conclusion

The creation and deployment of EduGuide PH: An AI-Powered Study and Career advising System successfully addressed the primary issues identified by Amigo School of Calinan, namely a lack of individualized academic help and accessible career advising. The project successfully delivered a web-based platform developed solely for student usage, serving as a centralized and intelligent tool for learning support.

The system's objectives were met with the successful integration of its primary features. Key features such as multilingual AI chatbot support (English, Tagalog, and Cebuano), automatic career path suggestions, voice input, and file attachment capabilities were all created, tested, and verified. The User Acceptance Testing (UAT) results indicated that student users were able to do all necessary tasks, including registering for an account, asking academic inquiries, exploring career alternatives, and using the platform's various input modalities. The successful completion of testing and training activities reveals that EduGuide PH is a functioning, dependable, and user-friendly tool capable of significantly improving students' academic experience and professional preparedness.

As a result, EduGuide PH met its objectives by providing a realistic, AI-driven solution to enhance the school's existing manual support methods.

Recommendations

While EduGuide PH successfully achieved its current objectives, several enhancements are recommended for future iterations to further improve its functionality and impact:

Offline Mode Implementation: While the initial deployment requires an internet connection, developing a basic offline mode or caching mechanism would allow students in areas with unstable connectivity to access previously viewed materials and quizzes. This would significantly improve accessibility, a key challenge identified in the report.

Integration with DepEd Resources: Integrating the system with the Department of Education's official learning management systems (e.g., DepEd Commons) would allow for a more seamless alignment with the national curriculum and provide access to a broader range of standardized educational content.

Expansion of Career Guidance: The career guidance feature could be enhanced by integrating with real-time data on in-demand professions, local college course offerings, and scholarship opportunities in the Philippines. This would make the career suggestions more actionable and relevant.

Quiz and Practice Test Enhancement: The system could be expanded to include more sophisticated AI-generated quizzes that adapt to a student's performance (adaptive testing), providing a more personalized and effective self-paced learning experience.

Improved Data Privacy and Security: As the system handles student data, continuous review and enhancement of security protocols are recommended to maintain compliance with data privacy laws (e.g., Data Privacy Act of 2012) and ensure the safety of user information.

Development of a Mobile Application: While the web-based platform is mobile-responsive, the development of dedicated iOS and Android applications could provide a more native, optimized, and engaging user experience for students who primarily use smartphones.
